The new generation of diaphragm valves

Innovation by revolution
Benefits
You can expect a great deal more from the new generation of diaphragm valves: More safety, simplicity and efficiency.

It began with the wish for something new. Out of this came something new for the market: safer, simpler and more efficient. Georg Fischer Piping Systems is revolutionizing your idea of a diaphragm valve.

Safety
Where there is no metal, there is no corrosion. Just like in the new generation of diaphragm valves from GF Piping Systems. Instead of the usual four metal screws, the new diaphragm valve has only a central plastic housing nut. And what is the direct advantage of this? The corrosion-free connection guarantees homogeneous expansion when exposed to temperature variations, which eliminates the need to retighten the screws. This results in uniform surface pressure that guarantees tightness up to 16 bar operating pressure.

Simplicity
Open or closed, automatic or manual: With flicks of the wrist the new diaphragm valve can increase flow or turn everything off completely. The lockable handwheel is a standard feature, the two-coloured position indicator shows the actual position of the diaphragm at a glance. Moreover, at the same time the upper housing section is the interface for a self-adjusting electrical position indicator. All the installation dimensions of the previous model were retained so it is backward compatible.

Efficiency
What is your definition of efficiency? 10, 15 or even 20 percent more? The new generation of diaphragm valves offers 100 percent more flow. That means doubling the flow rate at constant energy consumption. The key lies in the optimized geometry of the valve body. At the same time, the new diaphragm valve has linear flow characteristics and thus guarantees both increased efficiency and constantly stable processes. The minimized dead space also provides maximal hygiene.
Features

The sum of innovative developments guarantees the added value.

What is important and what isn’t? GF Piping Systems asked about the requirements and that was the basis for developing the technical solutions. This way of proceeding is what makes the valve so extraordinary. In the new generation of diaphragm valves, there is something over and above innovation in details that is crucial for success. The optimized valve body guarantees the sensational flow rate. The installation length is identical to the length in the previous model and this makes for problem-free backward-compatibility. The central housing nut holds everything together with a new level of reliability. There are many other characteristics that make the new generation of diaphragm valves a globally successful product innovation.

Functions and configurations can differ from the illustration, depending on the type.
The system
At a glance.

There are almost no limits to the applications of the new generation of diaphragm valves. Regardless of whether it is the manual or the pneumatic valve.

Materials
The application determines the material. Therefore, for optimal reliability, we offer you the choice of these materials: PVC-U, PVC-C, ABS as well as PP-H, PP-n and PVDF. With diaphragm materials available in EPDM, PTFE, FPM and NBR, the valves can be utilized with almost all chemicals.

Connections
Do you need a true union valve with solvent cement socket, do you want to weld in the valve, do you have to create a threaded connection to existing components of the plant or does the standard call for a specific flange? We help you with the right answer for a reliable connection.

International standards
No matter where you intend to use your valves, compatibility is obligatory. We ensure worldwide connection with international standards such as ISO, BS, ASTM, ANSI and JIS.

Standardization
Compliance with international standards:
- prEN ISO 16138
- Industrial valves – Diaphragm valves made of thermoplastics.
- ISO9393
- Valves made of thermoplastics.
- Pressure test and requirements.
- EN558
- Installation length of diaphragm valves corresponds to EN558.
- Approval reported: DIBt, W270, KTW, FDA and others.

Electrical feedback
In modern plant automation, process monitoring is increasing in importance. The optional electrical feedback can be easily assembled in a few steps.
- Removal of handwheel
- Attachment of electrical position indicator
- Attachment of handwheel
- Wiring of plugs
- One-time opening/closing of the valve for calibration.
System details
A product innovation that is more than the sum of its details.

The focus of the innovation was not the technical details but rather the absolute customer requirements. GF Piping Systems developed technical solutions in response to these requirements. The result can be seen in the details.

**Central housing nut**
Proven for decades in threaded unions and now applied to the housing: Simple, even surface pressure, no retightening. Very important: The uniform expansion with temperature changes of the plastic-plastic connection prevents leaks.

**Uniform diaphragm interface**
Simplified spare parts, easy exchange, enormous flexibility: The diaphragm interface was constructed in such a way that the threaded connection does not transfer pressure forces to the diaphragm pin.

**Two-coloured position indicator**
How far is my valve opened? The clearly visible two-coloured position indicator shows the actual position at a glance from a distance.

**Locking**
Is the process set? Secure it against undesired tampering with the integrated locking mechanism and with a padlock. In normal operation, the lock mechanism disappears in the handwheel, so that the ergonomics are not impeded.

**Optimised flow geometry**
An optimised flow geometry with soft transitions and radii doubles the flow rate compared to a typical diaphragm valve. The control characteristics are almost linear. A worldwide unique manufacturing procedure makes this possible. It also provides maximal hygiene with minimized dead space. With no disruptive flow turbulence, noise and wear and tear are significantly decreased. In addition to reduced pressure losses, an optimised flow rate also means that energy is conserved, and this lowers operating costs.
The DIASTAR system

Simple automation.

GF Piping Systems has the optimal actuator configuration for your individual needs. You can rely on the pneumatic DIASTAR valves.

**DIASTAR Six**
Are you looking for a cost-effective solution with a long working life for elastomer diaphragms up to 6 bar? Then you are on the right track with DIASTAR Six. It combines high quality with the basic functions of a pneumatic actuator. Its compact design is also an advantage.

**DIASTAR Ten**
Optimally suited for all standard applications up to 10 bar requiring integration of accessories. Uncomplicated integration into the plant automation is possible through the appropriate interface. DIASTAR Ten also offers the possibility of using a PTFE diaphragm. The cost-benefit ratio is unbeatable.

**DIASTAR TenPlus**
This is our actuator for high performance applications that require high closing forces. With the DIASTAR TenPlus line pressures up to 10 bar on both sides are possible. The valves are available in all piping and diaphragm materials and therefore offer maximum flexibility for your process. Of course it has an accessory interface for easy system integration.

**DIASTAR Sixteen**
This is our strongest one. The high closing force in combination with the special housing guarantees secure control of line pressure up to 16 bar. Are you looking for maximal reliability? And do you want an integrated accessory interface for simple system integration? Then DIASTAR Sixteen is the right choice.
Details DIASTAR
The right actuator for every situation. It’s quality is already well-known and now further optimised.

Building on the design of the manual valve, the pneumatic actuators from GF Piping Systems have also been thoroughly reworked. The result of this development can also be seen in the details.

Rotary air connection
In tight installation locations the actuators may be assembled back to back. The air connection can be turned to the desired position in 90° steps in all actuators.

Housing material
The fibreglass-reinforced PP housing material ensures that your actuator will withstand aggressive environmental conditions. Extensive use of plastics and stainless steel protects the interior of the valve.

Appropriate actuator and accessories
A long diaphragm working life is fundamental for the reliability of your application. That is why we offer you the right DIASTAR to correspond to your application with the use of 3, 4, or 6 spring assemblies for high closing forces and with integrated fixed stop in the actuator to avoid overloading the diaphragm. The low maintenance piston actuators with double spindle guide allows a long working life.

Mechanical interface and accessories
The DIASTAR Ten and Sixteen both have a mechanical interface to which accessories can be attached without difficulty. This is essential, since the actuation technology is an integral component of the total plant control. Our accessory program offers you a number of options for equipment that responds to your requirements. Stroke limiter, self-adjusting limit switches, positioner, pilot solenoid valves, valve clusters with bus communication, AS-i-control heads and more.

Comprehensive accessory assortment.

The rotary air connections permit compact installation of the unit.

Fixed stop and spring assemblies for a longer valve working life.
## Technical specifications

We have the right configuration of the new generation diaphragm valve for your individual needs.

Application range

There are applications for which safety, simplicity and efficiency are simply indispensible.

In short, everything is possible, from High Purity to particulate media. The new generation of diaphragm valves from GF Piping Systems always offers the optimal solution. No matter whether you must control and regulate extremely dirty, solid-containing or highly purified media. We are specialists in plastic piping systems and therefore we can offer the optimal combination of piping, gasket and jointing technique.

Chemical process industry
Aggressive environments can be found everywhere in the CPI. So it is important to know that the right plant components have been built in. The principle of the central thread eliminates completely the metal screws and thus eliminates the risk of corrosion. Good flow and linear regulation characteristics are basic requirements for efficient and reliable processes in dosing, mixing, filling and bottling of chemicals.

Microelectronics
Most processes in ME are carried out in a cleanroom. The requirements for water purity and the transport of UPW (Ultra Pure Water) are particularly high. The new generation of diaphragm valves has minimal dead space and greatly improved hygiene levels. Even heat expansion is not a problem, increasing reliability and reducing costly maintenance.

Water treatment
Water must be available cost-effectively everywhere at specified qualities. The revolutionary higher flow rate of the new diaphragm valve permits a significantly smaller pump design and clearly decreases costs. The pressure level up to 16 bar also permits integration of the diaphragm valve in reverse osmosis units and here too reduces operating costs.
Applications

Modern diaphragm valve technology for reliable process automation based on highly convincing features.

The new generation of diaphragm valves from GF Piping Systems is free of dead space, self-emptying, rugged and not sensitive to crystallizing media. Flow rate characteristic values and regulating characteristics are comparable to those of an angle seat valve. These impressive features make possible a series of application options.

Cooling applications
Simple and reliable regulation of the cooling temperature and the cooling chain is becoming increasingly important in cooling applications. Minimizing cooling agents that are harmful to the environment is a priority in this process. Increasingly, secondary cooling loops are being set up for which special valves made of ABS are necessary. The new generation of diaphragm valves is suitable for effective and high precision cooling because of the optimal flow and the regulating characteristics. Simple operation, guaranteed ruggedness and lack of sensitivity to crystallization are also relevant benefits.

Regulation applications
Today, numerous applications are highly automated, with compact construction. The DIASTAR pneumatic actuators can be integrated into modern automation solutions by means of accessory packages. The air connection is rotatable, and thus all the advantages are even effective in tight spaces. The valve geometry and the flow efficiency of the new generation of diaphragm valves open countless possibilities for applications. Technical data and regulating characteristics correspond to those of an angle seat valve without having to deal with its disadvantages.
